

## Quiz

### “Localization of Software”

Escudero Pascual Alberto <[aep@it46.se](mailto:aep@it46.se)>

Berthilson Louise <[louise@it46.se](mailto:louise@it46.se)>

Describe the step-by-step process to localize a computer software into a language which has not yet been introduced to computers. Briefly present each step (component) that needs to be taken to fully support a language in a computer. Describe each component in the order they depend on each other and explain the dependency. Distinguish between components that are basic requirements for software localization (i.e. the localized software can not exist without these components) and the components that act more as “adds on”.

For higher grade:

Choose a language (that is not a European language), complete the task described above but focus on the specific challenges of software localization for the selected language.

The answer should not be longer than 2 pages.
